Art Unit: 2614

1. The drawings are objected to because element 14 in Figs. 1-3 must be functionally labeled in compliance with rules 83(a) and 84(o). Corrected drawing sheets in compliance with 37 CFR 1.121(d) are required in reply to the Office action to avoid abandonment of the application. Any amended replacement drawing sheet should include all of the figures appearing on the immediate prior version of the sheet, even if only one figure is being amended. The figure or figure number of an amended drawing should not be labeled as "amended." If a drawing figure is to be canceled, the appropriate figure must be removed from the replacement sheet, and where necessary, the remaining figures must be renumbered and appropriate changes made to the brief description of the several views of the drawings for consistency. Additional replacement sheets may be necessary to show the renumbering of the remaining figures. The replacement sheet(s) should be labeled "Replacement Sheet" in the page header (as per 37 CFR 1.84(c)) so as not to obstruct any portion of the drawing figures. If the changes are not accepted by the examiner, the applicant will be notified and informed of any required corrective action in the next Office action. The objection to the drawings will not be held in abeyance.

2. The following is a quotation of the appropriate paragraphs of 35 U.S.C. 102 that form the basis for the rejections under this section made in this Office action:

A person shall be entitled to a patent unless –

(b) the invention was patented or described in a printed publication in this or a foreign country or in public use or on sale in this country, more than one year prior to the date of application for patent in the United States.

Claims 1-3 are rejected under 35 U.S.C. 102(b) as being anticipated by Kwak et al. (cited and provided by applicant).

Art Unit: 2614

The gamma correction circuit arrangement of Kwak (noting of Fig. 7) includes first and second LUTs (84, 86) that store digital (discrete) output intensity data and slope data of a non-linear (i.e. gamma curve) function, respectively; an adder 88 having a first input connected to the output of the first LUT; a multiplier 90 having its input connected to the output of the second LUT; a quantizer 82 that provides the most significant bits of the input video signal to both LUTs which transfer the corresponding output intensity data to the adder and the slope data to the multiplier, the multiplier multiplying the slope data with the least significant bits, which in turn is fed to the adder 88, the output thereof resulting in a corrected video signal, thereby meeting claim 1.

As for claim 2, the transfer functions of the two LUTs are designed to approximate a gamma correction characteristic (e.g. Fig. 9).

As for claim 3, the transfer functions of the two LUTs are designed to approximate a gamma correction characteristic, as noted previously, and the output of the adder 88 is further sent to processing means (e.g. DEMUX 44 shown in Fig. 3) to provide a fully gamma corrected video signal (as well as to further downstream processing for eventual and ultimate presentation on a display unit).

3. The prior art made of record and not relied upon is considered pertinent to applicant's disclosure.

4. Claims 4-11 appear allowable over the prior art.
